

ABSTRACT

A ping-pong paddle has a face (2) and a handle (3) which includes a forward handle part (4), oriented toward the face (2) and solidly connected to it, and a rear handle part (5-5''') axially adjoining the forward handle part (4). The ping-pong paddle (1-1^{IV}) offers the player an optimal hold on the handle and thus allows him to manipulate the paddle (1-1^{IV}) to suit his own individual preferences and traits. The handle part (3) can be rotatable about the axis of symmetry (7) that extends through the handle (3) and the face (2).
